DETAILED ACTION

Specification

The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

The incorporation of essential material in the specification by reference to an unpublished U.S. application, foreign application or patent, or to a publication is improper. Applicant is required to amend the disclosure to include the material incorporated by reference, if the material is relied upon to overcome any objection, rejection, or other requirement imposed by the Office. The amendment must be accompanied by a statement executed by the applicant, or a practitioner representing the applicant, stating that the material being inserted is the material previously incorporated by reference and that the amendment contains no new matter. 37 CFR 1.57(f).

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-5, 10-11 are rejected under 35 U.S.C. 102(b) as being anticipated by Soremark, U.S. Patent 5,961,920.

The Soremark patent discloses an apparatus for conditioned air comprising the claimed flux generator and an activator, which can be the UV light source or the type creating an intense electrical field (see claims 1-9 and col. 5, lines 43-56). The reference further discloses the same types of organic compound, such as the claimed terpene including aldehydes and ketones (see col. 3, lines 4-15).

The reference further discloses the claimed method, wherein providing the same type of gaseous organic material, oxidizing said material by ozone and UV and mixing the oxidized material with said fluid to be purified (see col. 5, lines 10-42).

Therefore, since the Soremark patent discloses each and every limitation, the claims are anticipated.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 6-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Soremark as applied to claims above, and further in view of Kishkovich et al. (Kishkovich), U.S. Patent 6,096,267.

The Soremark patent does not disclose that the apparatus further comprises a facemask portion or the use of a photodetector and excitation source to determine airborne particles.

The Soremark patent discloses the use of the apparatus within confined places, such as cabins and toilets (see col. 5, lines 35-42). Accordingly, to use the apparatus in a smaller space, such as a facemask would have been an obvious modification, because the Soremark patent teaches the use of the apparatus in a small space.

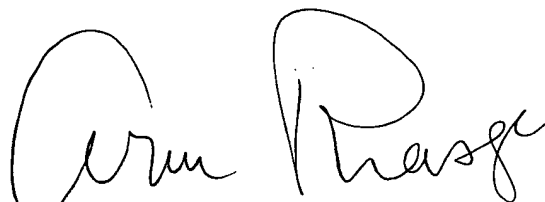

The Kishkovich patent is cited to show the use of a photodetector and excitation source to determine the particles in air treatment (see col. 6, lines 6-23). Consequently, the invention as a whole would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the disclosure of the Soremark patent with the teachings of the Kishkovich patent, because the Kishkovich patent teaches the use of a photodetector and excitation source to maintain clean air.
